

Grid Economy and Business Models – from Web to Grids –

Daniel J. Veit

Professor and Chair of Business Administration and
Information Systems
– E-Business and E-Government –
Business School

**UNIVERSITÄT
MANNHEIM**
Germany

Joint Work with **Torsten Eymann, Björn Schnizler, Dirk Neumann**

Research Projects

- **CatNets:** Catallaxy paradigm for decentralized operation of dynamic application networks
 - STREP in FP 6, duration: 8/2004-8/2007
 - 6 partners within EU
 - Web: www.catnets.org

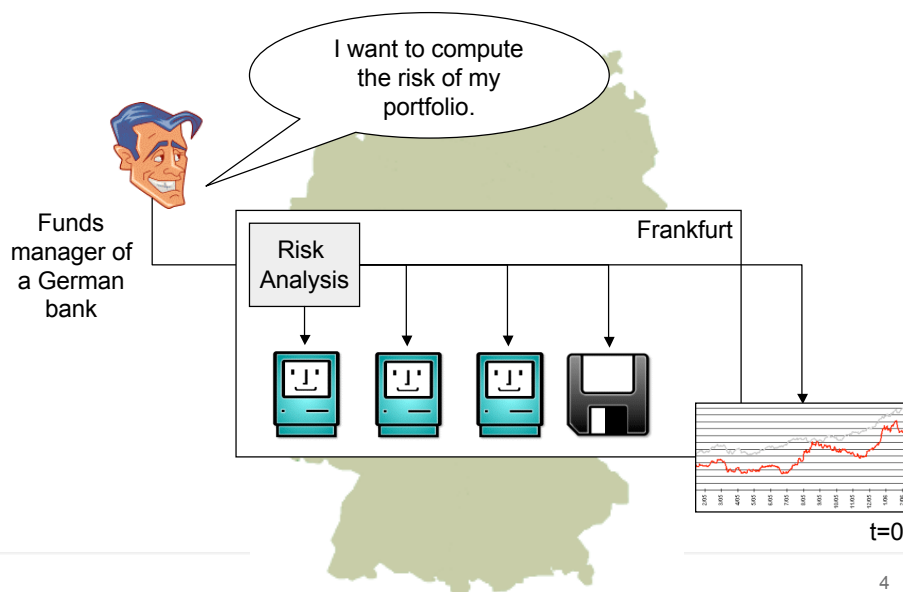

- **SORMA:** Self-Organizing ICT Resource Management
 - STREP in FP 6, duration: 9/2006-9/2009
 - 10 partners within EU
 - 2 partners from Asia/Israel
 - Web: www.sorma-project.org

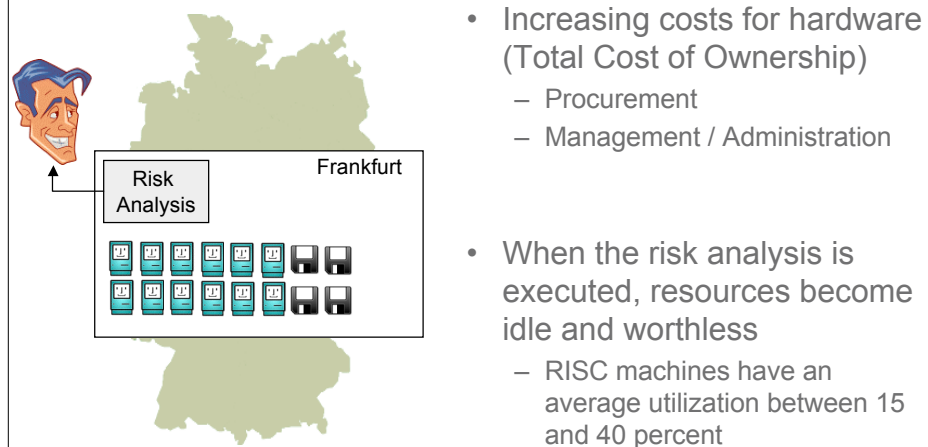

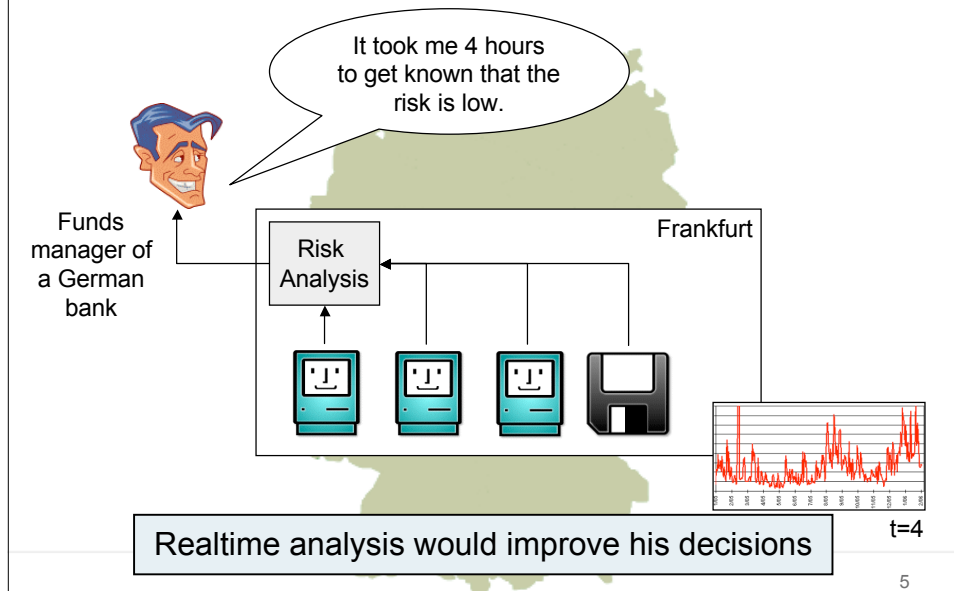

PowerACE

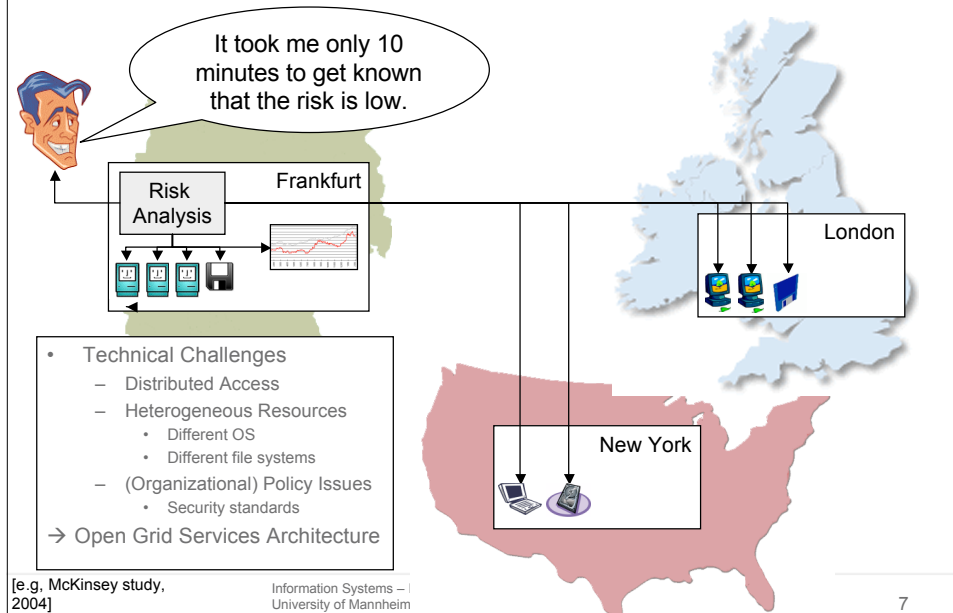

- **PowerACE:** Effects of emissions trading and the increased use of renewable energy sources on power markets
 - Funded by VolkswagenFoundation, duration 5/2004-8/2007
 - 3 partners from Germany, Web: www.powerace.de

- ➔ ▪ **Motivation**
- **Technical Solution**
- **Economic Challenges**
- **EU Project CatNets: Allocating Grid Resources using Auctions**
- **EU Project SORMA: The Open Grid Market**
- **Wrap up**

[Gartner, 2004]

- EU Project CatNets: Allocating Grid Resources using Auctions
- EU Project SORMA: The Open Grid Market
- Wrap up

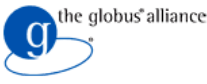

Open Grid Services Architecture (OGSA)

- OGSA is an Open Grid Forum (OGF) standardization effort
- OGSA defines all resources (physical and logical) as services
 - Conflation of Web services and Grid technologies
 - Storage-, Computation-, Database service
 - Virtualized IT-infrastructure
- Grid becomes a *Service Oriented Architecture*
 - Improved interoperability
- Globus Toolkit 4 (GT4) as reference implementation
 - Provides common Grid management services
 - Resource management, Security, Authorization, ...
 - Provides the base for deploying Grid applications

Why Engineering a Grid Market?

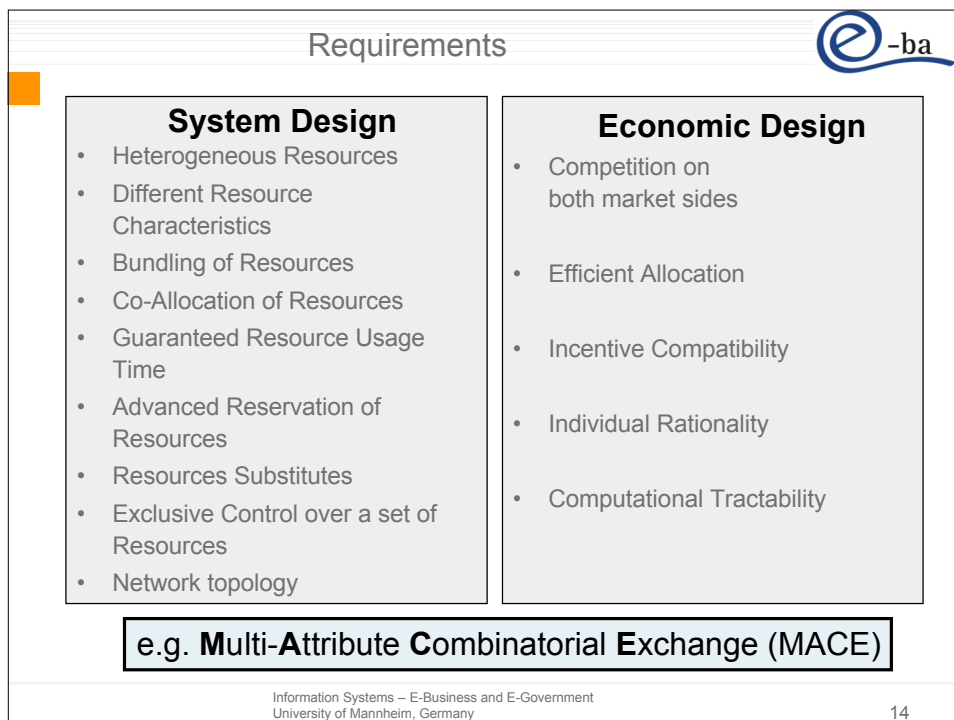

- **Idea** of applying Markets to distributed systems is old ...
 - Ferguson et al. [1988]: Market based load balancing
 - Regev, Nisan [1998]: Popcorn, Market for CPU scheduling
 - Buyya et al. [2002]: Grid economy
 - [...]
- **None** of the proposed mechanisms is applied in commercial apps
- **Why?** Lack of a systematic and structured view on
 - System Design Challenges
 - What is traded? What are the technical requirements? How can they be realized in a market?
 - Economic Design Challenges
 - What is the objective of the allocation? What are the economic requirements?

MACE: An Auction for trading Grid Services

- **Multi-attribute Combinatorial Exchange**
 - **Supports:**
 - Bundle and XOR bids
 - Quality and time attributes
 - **Requirements:** Bidding Language, Allocation and Pricing Rule
- **Bidding Language**

CatNets Facts

- EU IST FP 6
- 2004 – 2007
- 6 European Partners

$$B_n(S_i) = (v_n(S_i), (q_n(S_i, g_1, a_{g_1,1}), \dots, q_n(S_i, g_j, a_{g_j,A_j}), s_n(S_i), e_n(S_i), l_n(S_i)))$$

Bundle (e.g. Computation AND storage)

Valuation/Reservation prices

Quality attributes (e.g. 30GB of free space)

Slots

Start

End

- Fulfills requirements upon a Grid system
 - Compliant with WS-Agreement specification

www.catnets.org

MACE: An Auction for trading Grid Services

- **Winner Determination**
 - Maximize difference between buyers' valuations and sellers' reservation prices
 - Formalized as Linear Mixed Integer Program:

$$\max_{z_{n,t}(S_i), y_{m,n,t}(S_i)} \sum_{n \in \mathcal{N}} \sum_{S_i \in \mathcal{S}} \sum_{t \in \mathcal{T}} v_n(S_i) z_{n,t}(S_i) - \sum_{m \in \mathcal{M}} \sum_{n \in \mathcal{N}} \sum_{S_i \in \mathcal{S}} \sum_{t \in \mathcal{T}} r_m(S_i) y_{m,n,t}(S_i)$$

$$\text{s.t. } feasible(x_n(S_i), z_{n,t}(S_i), y_{m,n,t}(S_i))$$

- Feasible Means:
 - Logical operators (XOR, AND), quality and time restrictions are met

- **Pricing**
 - Approximated Vickrey Pricing *(Parkes et al., 2001)*
 - K-Pricing *(Schnizler, Neumann, Veit, Weinhardt 2006)*

Information Systems – E-Business and E-Government
University of Mannheim, Germany

18

- **Implementation**

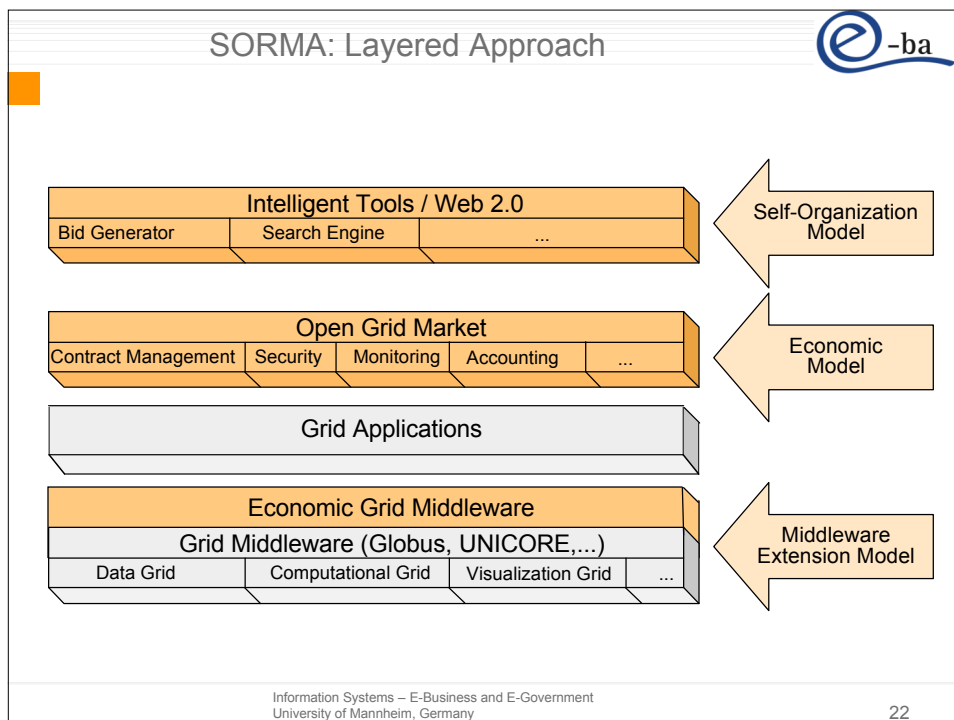

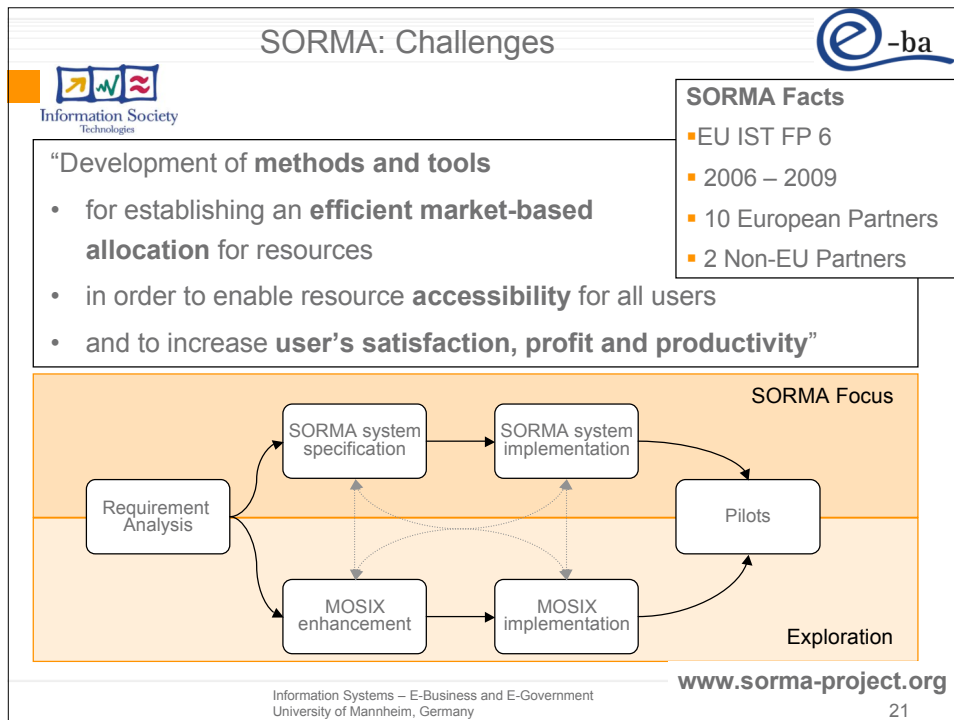

- jCase: Java Combinatorial Auction Simulation Environment
- OptorSim Simulator

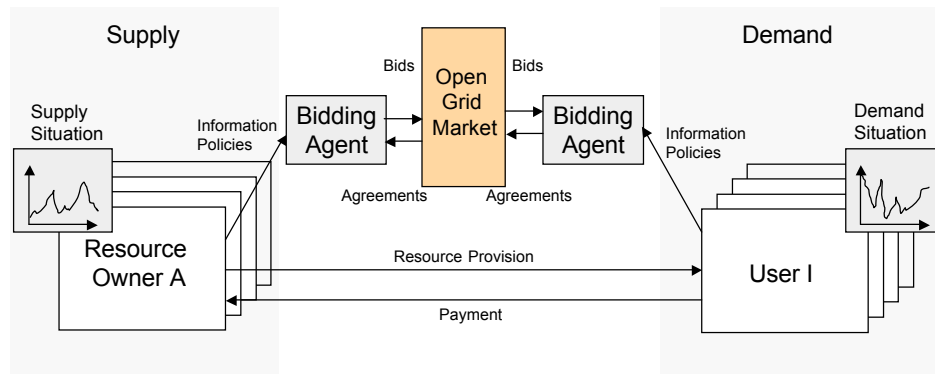

- **Evaluation**

- Incentive Compatibility
 - Can participants gain utility by manipulating bids?
 - K-Pricing Schema is “approximate” incentive compatible
- Performance Evaluation
 - Is the mechanism tractable with an increasing number of bids?
 - For large-scaled settings, approximations are required

- **Motivation**
- **Technical Solution**
- **Economic Challenges**
- **EU Project CatNets: Allocating Grid Resources using Auctions**
- ➔ ▪ **EU Project SORMA: The Open Grid Market**
- **Wrap up**

- **Open Grid Market**
 - Definition and evaluation of market mechanisms
 - Accounting and billing
 - Security
 - Integration of the market into the SORMA system

- **Motivation**
- **Technical Solution**
- **Economic Challenges**
- **EU Project CatNets: Allocating Grid Resources using Auctions**
- **EU Project SORMA: The Open Grid Market**
- ➔ ▪ **Wrap up**

- *Recommendation:* Modeling of a two-tiered cost-oriented resource allocation scheme for E-Infrastructures based on a hybrid centralized/decentralized market mechanism for Grids and distributed architectures.
- *Recommendation:* Introduction of a billing scheme for post-allocation resource billing in E-Infrastructures. Enabling of a cost-/profit-center concept for the utilization or computational resources.

- Why “Markets” for Grid resources?
 - Efficient allocation
 - Pricing of scarce computational resources
- Technical versus economic allocation of Grid services
 - Grids become *Service Oriented Architectures (SOA)*
 - *Technical and economical allocation often diverse*
- Strong efforts in commercialization of Grid services
 - Pricing/business/allocation models needed
 - “Convincing” of companies about usefulness of Grid
 - Utilization of Grid technology in E-Business scenarios
